

README

Henrik Christiansen

January 20, 2021

Project: radseq pilot

RADseq optimization pilot experiment with several Antarctic species.

Contact: henrik.christiansen@kuleuven.be

Log:

20/01/2020: added new xml file for run 7, updated bioanalyzer to v0.6.2 and updated 02_empirical_digests.R

20/01/2020: added the project to a github repository

16/12/2020: added a modified read.bioanalyzer function to read in xml file with a missing lower marker in one sample

14/12/2020: small, mostly cosmetic updates in most scripts; updated project and input/output description; finalized 02_empirical_digests.R

11/12/2020: added customized plot saving function in recto_REs_and_functions.R

10/12/2020: updated 02_empirical_digests.R, added a customized ggplot plotting function in recto_REs_and_functions.R added in silico functions for comparison in recto_REs_and_functions.R

11-12/2020: updated 02_empirical_digests.R & added a customized plotting function in recto_REs_and_functions.R

11/11/2020: updated to run with R v4.0.3

07-10/2020: added script 02_empirical_digests.R to read results from bioanalyzer and analyze them in R, instead of cumbersome “manual” analysis in spreadsheets

20/07/2019: updated plot ratio scripts

10/07/2019: updated digest scripts

09/07/2019: updated the plots for test library 2

02/07/2019: updated digest scripts

28/06/2019: finalized coverage plot

27/06/2019: re-orderd scripts, included scripts for in silico digestion (previously stored in different R project)

23-27/06/2019: updated parameter plots (now based on correct de novo runs, with PE concatenating); included & updated coverage plot

16-22/06/2019: updated parameter plots; started script to plot targeted and realized coverage

01-14/06/2019: included scripts to plot n_loci and n_snps_per_locus from de novo parameter optimization series

04/12/2018: rerun due to updated input data (Trematomus mainly)

29/11/2018: created script 01_plotting.R and ratio plots

28/11/2018: created R project & input data

Input:

Various reference genomes from target species, or related species in fasta format under:

- /data/refgenomes

Output files from the Agilent Bioanalyzer Software in XML format under:

- data/bioanalyzer_results

CSV file with all metadata related to the Bioanalyzer runs, created manually:

- data/bioanalyzer_results/run_overview.csv

CSV/TSV files in data/test_libraries with data from 5 test libraries:

- coverage_stats.csv: coverage for each library under different M values
- various n_snps_per_locus.tsv: files for each library/species and different r/M values with information about the loci and SNPs

R script that contains restriction enzyme information and various functions for analysis and plotting as used in the analyses scripts:

- analyses/recto_REs_and_functions.R

Additional R script to export plots consistently:

- ~/printfig.R

Analyses:

To be run sequentially, all listed under /analyses.

- 01_digests.R: script to perform in silico digestions for different target organisms
- 02_empirical_digests.R: script to read bioanalyzer results and plot output in comparison with in silico results
- 03_plot_n_loci.R: script based on Rochette & Catchen 2017 to plot the number of (polymorphic) loci for different M parameters
- 04_plot_n_snps_per_locus.R: script based on Rochette & Catchen 2017 to plot the number of SNPs per locus for different M parameters
- 05_plot_coverage.R: script to plot target and realized coverage

Output:

In /data/in_silico_results:

- various tables.csv containing in silico digest results per target taxa

In /figures:

- genome digestion curves, empirical and in silico, created with 02_empirical_digests.R
- various n_loci_Mn plots per library, created with 03_plot_n_loci.R
- various n_snps per library/species, created with 04_n_snps_per_locus.R
- coverage plots, created by 05_plot_coverage.R

Session info:
